SEROLOGY

DENGUE COMBO SCREEN, RAPID, SERUM

DENGUE SPECIFIC ANTIBODIES, IGG	NOT DETECTED	NOT DETECTED		IMMUNOCHROMATOGRAPHY
DENGUE SPECIFIC ANTIBODIES, IGM	NOT DETECTED	NOT DETECTED		IMMUNOCHROMATOGRAPHY
DENGUE NS1 ANTIGEN	NOT DETECTED	NOT DETECTED		IMMUNOCHROMATOGRAPHY

Specimen:  
SERUM

Dengue fever is a viral disease transmitted by mosquitoes and caused by four serotypes of dengue virus (DEN): DEN-1, DEN-2, DEN-3, and DEN-4. Since IgM antibodies are detectable only after 3-5 days of infection, henceforth detection of antibodies is not very suitable for diagnosis of early phase of infection.

It has been found that the NS1 antigen is present in high concentrations in patient's sera during the early clinical phase of the disease. Combined detection of NS1 antigen, IgG and IgM antibodies in single step helps for early and differential diagnosis of primary and secondary dengue infection. Method of testing: Rapid Immunochromatographic method

Note: Rapid chromatographic card test is a screening test for Dengue antigen & antibodies.

Advised: Confirmation of results by ELISA method for Dengue NS1/ Dengue IgM/ Dengue IgG.
