Specimen:
STOOL

Acute infective diarrhea and gastroenteritis are major causes of ill health and premature death in India. Laboratory diagnosis of parasitic infection is primarily based on microscopic examination of the stool specimen. The microscopic observations include the identification of cysts, ova, trophozoites, larvae or portions of adult structure. The protozoan infections is mainly caused by Entamoeba histolytica and Giardia lamblia. The common helminthic parasites are Trichuris trichiura, Ascaris lumbricoides, Strongyloides stercoralis, Taenia spp. etc.
Method of testing: Microscopy. A series of three specimens submitted on alternate days is recommended.
